

## 4.4: Eigenvalues & the characteristic Poly.

4.4  
1/2

$$A = \begin{bmatrix} 13 & -16 \\ 9 & -11 \end{bmatrix} \Rightarrow p(t) = (t-1)^2$$

$$B = \begin{bmatrix} -2 & -1 & 0 \\ 0 & 1 & 1 \\ -2 & -2 & -1 \end{bmatrix} \Rightarrow p(t) = -t(t+1)^2$$

Goal: (1) Find all scalars  $\lambda$  s.t.  
 $A - \lambda I$  is singular.

(2) Given  $\lambda$ , find all  $x \neq \theta$  s.t.  
 $(A - \lambda I)x = \theta$ .

If  $A$  ( $n \times n$ ), then  $\det(A - tI)$  is  
a poly w/ degree  $n$  in  $t$ .  
We call it the characteristic  
poly for  $A$ .

Note that the roots of  $p(t)$ ; where  
 $p(t) = 0$  are the eigenvalues of  $A$ .

By the FT,  $A$

- (a) An ( $n \times n$ ) matrix can have no more than  $n$  distinct eigenvalues.
- (b) An ( $n \times n$ ) matrix always has @ least one eigenvalue (possibly complex)

Thm: Let  $A$  be an  $(n \times n)$  matrix &  
let  $\lambda$  be an eigenvalue of  $A$ .

Then:

prove it  $\rightarrow$  (a)  $\lambda^k$  is an eigenvalue of  
 $A^k$  for  $k = 2, 3, \dots$

prove it  $\rightarrow$  (b) If  $A$  is nonsingular, then  $\frac{1}{\lambda}$   
is an eigenvalue of  $A^{-1}$ .

(c) If  $\alpha$  is any scalar, then  $\lambda + \alpha$   
is an eigenvalue of  $A + \alpha I$ .

Thm: Let  $A$  be  $(n \times n)$ . Then  $A$  &  $A^T$   
have the same eigenvalues.

Thm: Let  $A$  be  $(n \times n)$ . Then  $A$  is  
singular iff  $\lambda = 0$  is an eigenvalue  
of  $A$ .  
prove it  $\rightarrow$

Thm: Let  $T = (t_{ij})$  be an  $(n \times n)$  triangular  
matrix. Then the eigenvalues of  $T$   
are the diagonal entries.  
prove it  $\rightarrow$
