

Test 3

Dusty Wilson  
Math 220

Name: key.

*Mathematics is a game played according to certain simple rules with meaningless marks on paper.*

No work = no credit

$$\det \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = -2$$

David Hilbert  
1862 - 1943 (Prussian mathematician)

$$\det(I) = 1$$

$$\det(A^{-1}) = -\frac{1}{2}$$

Warm-ups (1 pt each):

$$A\theta = \underline{\hspace{2cm}}$$

$$\theta^T \cdot \theta = \underline{\hspace{2cm}}$$

$$\theta \cdot \theta^T = \underline{\hspace{2cm}}$$

1.) (1 pt) According to Hilbert, how much transcendent or intrinsic meaning is there in mathematics? (See above). Answer using complete English sentences.

There is no meaning. Math is just a game.

2.) (10 pts) Find the QR factorization of  $A = \begin{bmatrix} 1 & 0 \\ 1 & 2 \\ 0 & 1 \\ 2 & 2 \end{bmatrix}$

$$\vec{v}_1 = \begin{bmatrix} 1 \\ 1 \\ 0 \\ 2 \end{bmatrix}$$

$$\|\vec{v}_1\| = \sqrt{6}$$

$$\vec{u}_1 = \begin{bmatrix} 1/\sqrt{6} \\ 1/\sqrt{6} \\ 0 \\ 2/\sqrt{6} \end{bmatrix}$$

$$\vec{v}_2 = \begin{bmatrix} 0 \\ 2 \\ 1 \\ 2 \end{bmatrix}$$

$$\vec{v}_2^\perp = \vec{v}_2 - \underbrace{\langle \vec{u}_1, \vec{v}_2 \rangle}_{\sqrt{6}} \vec{u}_1 =$$

$$\begin{bmatrix} -1 \\ 1 \\ 1 \\ 0 \end{bmatrix}$$

$$\|\vec{v}_2^\perp\| = \sqrt{3}$$

$$\vec{u}_2 = \begin{bmatrix} -1/\sqrt{3} \\ 1/\sqrt{3} \\ 1/\sqrt{3} \\ 0 \end{bmatrix}$$

$$A = QR = \begin{bmatrix} 1/\sqrt{6} & -1/\sqrt{3} \\ 1/\sqrt{6} & 1/\sqrt{3} \\ 0 & 1/\sqrt{3} \\ 2/\sqrt{6} & 0 \end{bmatrix} \begin{bmatrix} \sqrt{6} & \sqrt{6} \\ 0 & \sqrt{3} \end{bmatrix}$$

3.) (10 pts) Consider the experimental observations given in the following table:

$t$	1	4	8	11
$y$	1	2	4	5

Find the least-squares linear ( $y = mt + b$ ) fit to the data using techniques developed in linear algebra.

Give exact values,

$$A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \\ 8 & 1 \\ 11 & 1 \end{bmatrix} \quad \vec{b} = \begin{bmatrix} 1 \\ 2 \\ 4 \\ 5 \end{bmatrix} \quad \text{SPCS.}$$

$$\begin{aligned} \text{Solve } A\vec{x} &= \vec{b} \quad \Rightarrow \quad \vec{x}^* = (A^T A)^{-1} A^T \vec{b} \\ &= \begin{bmatrix} 12/29 \\ 15/29 \end{bmatrix} \\ &\approx \begin{bmatrix} 0.4137 \\ 0.5172 \end{bmatrix} \end{aligned}$$

$$y = \frac{12}{29}t + \frac{15}{29}$$

Find the magnitude of the minimum error vector.

$$\vec{\text{error}} = \vec{b} - A\vec{x}^* = [0.069 \quad -0.17 \quad 0.17 \quad -0.069]^T$$

$$\begin{aligned} \text{and } \|\vec{\text{error}}\| &\approx \sqrt{0.06897} \\ &\text{or exactly } \sqrt{\frac{2}{29}} \end{aligned}$$

4.) (5 pts) How do you determine if a matrix  $A$  is orthogonal?

method 1:  $A^T A = I$  iff  $A$  is orthogonal.

method 2: dot all cols w/ each other. If  $A$  is orthogonal, all ~~cols~~ dot products are zero but where a vector is dotted w/ itself in which case it is 1.

5.) (5 pts) Consider the sketch below.

(a.) Clearly and carefully draw and label the orthogonal projection of  $\vec{v}$  onto the line  $L$ .

(b.) Explain how you would find it given some vector  $\vec{v}$  and the equation of the line  $L: c_1x + c_2y = 0$ .

(1) find the direction of  $L$ :

$$\vec{w} = \begin{bmatrix} c_2 \\ -c_1 \end{bmatrix}$$

(2) find a unit vector parallel to  $\vec{w}$ :  $\vec{u} = \frac{\vec{w}}{\|\vec{w}\|}$

(3) find  $\text{proj}_L \vec{v} = (\vec{u} \cdot \vec{v}) \vec{u}$

6.) (5 pts) If  $A = QR$  is a  $QR$  factorization, prove  $A^T A$  equals  $R^T R$ .

□ proof.

Assume  $A$  has the  $QR$  factorization  $A = QR$ .

$$\Rightarrow A^T A = (QR)^T (QR)$$

$$= R^T Q^T Q R$$

$$= R^T I R$$

$$= R^T R$$

QED.

7.) (5 pts) Suppose you are given two vectors  $\vec{v}_1$  and  $\vec{v}_2$  in  $\mathbb{R}^3$  below and told to use Gram-Schmidt to generate an orthogonal basis  $\{\vec{u}_1, \vec{u}_2\}$  spanning the plane. Clearly and carefully sketch and label these vectors given that  $\|\vec{v}_1\| = 2$ .

8.) (10 pts) Use the determinant to find out for which values of the constant  $\lambda$  the matrix  $A - \lambda I$  fails to be invertible.

$$A = \begin{bmatrix} 3 & 5 & 6 \\ 0 & 4 & 2 \\ 0 & 2 & 7 \end{bmatrix}$$

$$A - \lambda I = \begin{bmatrix} 3-\lambda & 5 & 6 \\ 0 & 4-\lambda & 2 \\ 0 & 2 & 7-\lambda \end{bmatrix}$$

$$\det(A - \lambda I) = (3-\lambda) \begin{vmatrix} 4-\lambda & 2 \\ 2 & 7-\lambda \end{vmatrix}$$

$$= (3-\lambda) \left[ (4-\lambda)(7-\lambda) - 4 \right]$$

$$28 - 11\lambda + \lambda^2$$

$$= (3-\lambda) (\lambda^2 - 11\lambda + 24)$$

$$= (3-\lambda) (\lambda-3) (\lambda-8)$$

$$= -\lambda^3 + 14\lambda^2 - 57\lambda + 72.$$

$A$  is not invertible when  $\lambda = 3$  and  $\lambda = 8$

9.) (5 pts) What are two geometric interpretations for  $\det \begin{pmatrix} 2 & 1 \\ 3 & 4 \end{pmatrix} = 5$ ?

(1) The area of the parallelogram determined by the cols of  $A$ .

(2) The expansion factor of the linear trans.  $A$ .
