

Strategy for Testing Series

THE LIST

Let's do a brief review of all the tests we have introduced for determining convergence and how to decide which test to use.

To do this, remember the 4 known series:

➤ Geometric series: $\sum_{n=0}^{\infty} ar^n$ $\begin{cases} \text{converges} & \text{if } |r| < 1 \\ \text{diverges} & \text{if } |r| \geq 1 \end{cases}$

➤ P-series: $\sum_{n=1}^{\infty} \frac{1}{n^p}$ $\begin{cases} \text{converges} & \text{if } p > 1 \\ \text{diverges} & \text{if } p \leq 1 \end{cases}$

The harmonic series

$\sum_{n=1}^{\infty} \frac{1}{n}$ diverges

Let $\sum_{n=1}^{\infty} a_n$ be given.

The alternating harmonic series

$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ converges (conditionally)

For Positive Series:

- **The Divergent Test (nth-Term Test):** Always check this test first.

(easy weak)

Test for Divergence.

$$\lim_{n \rightarrow \infty} a_n \begin{cases} = 0 & \text{then inconclusive!} \\ \neq 0 & \text{then } \sum_{n=1}^{\infty} a_n \text{ diverges} \end{cases}$$

- **The Direct Comparison Test:** Consider whether dropping terms in the numerator or denominator gives a series that we know converges or diverges, $\sum_{n=1}^{\infty} b_n$.

(hard powerful)

If $a_n \leq b_n$ and $\sum_{n=1}^{\infty} b_n$ converges then $\sum_{n=1}^{\infty} a_n$ converges

If $a_n \geq b_n$ and $\sum_{n=1}^{\infty} b_n$ diverges then $\sum_{n=1}^{\infty} a_n$ diverges

$\sum b_n$ known

Bigger	Smaller
$\sum a_n$ converges	$\sum a_n$ inconclusive
$\sum a_n$ inconclusive	$\sum a_n$ diverges

- **The Limit Comparison Test:** Consider the dominant term in the numerator and denominator, and come up with a series that we know converges or diverges, $\sum_{n=1}^{\infty} b_n$.

(strong easy)

○ If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} \begin{cases} > 0 \\ \text{finite} \end{cases}$, then either $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ both converge or both diverge.

○ If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$ and $\sum_{n=1}^{\infty} b_n$ converges, then $\sum_{n=1}^{\infty} a_n$ converges.

○ If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty$ and $\sum_{n=1}^{\infty} b_n$ diverges, then $\sum_{n=1}^{\infty} a_n$ diverges.

$\sum b_n$ known

converges	$\sum a_n$ converges
diverges	$\sum a_n$ diverges

(easy - strong)

- **The Ratio Test.** Best to use when there is a factorial or a constant to the power of n . *Don't use w/ p-series.*

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \begin{cases} < 1 & \text{then absolutely-convergent} \Rightarrow \text{convergent} \\ > 1 & \text{then divergent} \\ = 1 & \text{then inconclusive!} \end{cases}$$

(easy - weak)

- **The Root Test.** Best to use when the terms have power n . *Don't use w/ p-series.*

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \begin{cases} < 1 & \text{then absolutely-convergent} \Rightarrow \text{convergent} \\ > 1 & \text{then divergent} \\ = \infty & \text{then divergent} \\ = 1 & \text{then inconclusive!} \end{cases}$$

(hard - weak)

- **The Integral Test.** Best to use when the other tests fail. If $a_n = f(n)$ is decreasing, positive and continuous,

$$\int f(x) dx \begin{cases} \text{converges then } \sum_{n=1}^{\infty} a_n \text{ converges} \\ \text{diverges then } \sum_{n=1}^{\infty} a_n \text{ diverges} \end{cases}$$

(hard - weak)

- **Telescoping series.** Use this when the terms can be written as a difference where terms cancel. The examples often require basic partial fractions, log rules, or trig identities.

For Series That Are Not Positive Series:

- **Alternating Series Test.** For series of the form $\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} (-1)^{n-1} b_n$

$$\text{If } \begin{cases} b_{n+1} \leq b_n \\ \lim_{n \rightarrow \infty} b_n = 0 \end{cases} \text{ then } \sum_{n=1}^{\infty} a_n \text{ converges (either absolutely or conditionally).}$$

Reminder: Absolute Convergence. If $\sum_{n=1}^{\infty} a_n$ has some negative terms (maybe alternating or not), then

consider $\sum_{n=1}^{\infty} |a_n|$. If $\sum_{n=1}^{\infty} |a_n|$ converges, $\sum_{n=1}^{\infty} a_n$ is converging absolutely.

In short:

1. **The nth-Term Test:** Unless $a_n \rightarrow 0$, the series diverges.
2. **Geometric series:** $\sum ar^n$ converges if $|r| < 1$; otherwise it diverges.
3. **p-series:** $\sum \frac{1}{n^p}$ converges if $p > 1$; otherwise it diverges.
4. **Series with nonnegative terms:** Try the Integral Test, Ratio Test or Root Test. Try comparing to a known series with the Comparison Test or the Limit Comparison test.
5. **Series with some negative terms:** Does $\sum |a_n|$ converges? If yes, so does $\sum a_n$ since absolute convergence implies convergence.
6. **Alternating series:** $\sum a_n$ converges if $\sum |a_n|$ is decreasing and $|a_n| \rightarrow 0$.
