<u>2.2 – The Inverse of a Matrix</u>

($I = I_n$ is the $n \times n$ identity matrix.)

X

Here, C is called the <u>Inverse</u> of A. Is C unique? Prove Inverse of A is Let B be another inverse of A, unique. B = B(I) = B(AC) = (BA)C = IC = C: Inverse is Unique

Yes, so denote the inverse with A^{-1} and

$$A^{-1}A = I$$
 and $AA^{-1} = I$

A matrix that is **NOT** invertible is called a <u>Singular</u> matrix while a matrix that **IS** invertible is called a <u>nonsingular</u> matrix.

Ex 1: If
$$A = \begin{bmatrix} -2 & -3 \\ 3 & 5 \end{bmatrix}$$
 and $C = \begin{bmatrix} -5 & -3 \\ 3 & 2 \end{bmatrix}$, verify that $C = A^{-1}$.
 $A \subseteq \begin{bmatrix} -2 & -3 \\ -3 & 5 \end{bmatrix} \begin{bmatrix} -5 & -3 \\ -3 & 2 \end{bmatrix} = \begin{bmatrix} 10 - 9 & 6 - 6 \\ -15 + 15 & -9 + 10 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \boxed{1}$
 $C A = \begin{bmatrix} -5 & -3 \\ -3 & 2 \end{bmatrix} \begin{bmatrix} -2 & -3 \\ -3 & 5 \end{bmatrix} = \begin{bmatrix} 10 - 9 & 15 - 15 \\ -6 + 6 & -9 + 10 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \boxed{1}$

Theorem 4 Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$. If $ad - bc \neq 0$, then A is invertible and $A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$

If ad - bc = 0, then A is not invertible.

This value ad-bc is called the <u>determant</u> and we write

 $\frac{\det A = ad - bc}{\text{So theorem 4 states that } 2 \times 2 \text{ matrix is invertible} \quad \text{iff } \frac{\det A \neq 0}{(\text{if and } only \text{ if })}$

Ex 2: Find the inverse of
$$A = \begin{bmatrix} 3 & -7 \\ 2 & 5 \end{bmatrix}$$
.
 $A^{-1} = \frac{1}{29} \begin{bmatrix} 5 & 7 \\ -2 & 3 \end{bmatrix} = \begin{bmatrix} \frac{5}{29} & \frac{7}{29} \\ -\frac{2}{29} & \frac{3}{29} \end{bmatrix}$

Theorem 5

If A is an invertible $n \times n$ matrix, then for each **b** in \mathbb{R}^n , the equation $A\mathbf{x} = \mathbf{b}$ has the unique solution $\mathbf{x} = A^{-1}\mathbf{b}$. $A^{-1}A \stackrel{\sim}{\times} = A^{-1}\mathbf{b}$.

Proof: Let
$$\vec{b} \in \mathbb{R}^n$$
, does $A\vec{x} = \vec{b}$ have a $\vec{x} = \vec{A} \cdot \vec{b}$
A is invertible, so $A^{-1} = xists$, let $\vec{x} = A^{-1}\vec{b} = A\vec{x} = A(\vec{A} \cdot \vec{b}) = (AA^{-1})\vec{b} = I\vec{b} = \vec{b} \Rightarrow soln = xists$
 $\frac{Uniqueness}{Iet \vec{u} be another solution to A\vec{x} = \vec{b}}$
 $\vec{A}\vec{u} = \vec{b} \Rightarrow \vec{A} \cdot \vec{A} \cdot \vec{u} = \vec{A} \cdot \vec{b}$
 $\vec{u} = A^{-1}\vec{b} = \vec{x}$
 $\vec{u} = Soln unique$

Ex 3: Use the inverse of the matrix $A = \begin{bmatrix} -2 & -3 \\ 3 & 5 \end{bmatrix}$ from Ex 1 $\begin{pmatrix} A^{-1} = \begin{bmatrix} -5 & -3 \\ 3 & 2 \end{bmatrix} \end{pmatrix}$ to solve the system $\begin{array}{c} -2x_1 - 3x_2 = 5 \\ 3x_1 + 5x_2 = -7 \end{pmatrix}$ $A \stackrel{\sim}{\Rightarrow} = \stackrel{\sim}{b} \stackrel{\sim}{\Rightarrow} \stackrel{\sim}{x} = \stackrel{\sim}{A} \stackrel{\vee}{b} \stackrel{\sim}{\Rightarrow} \stackrel{\sim}{x} = \stackrel{\sim}{A} \stackrel{\vee}{b} \stackrel{\sim}{\Rightarrow} \stackrel{\sim}{x} = \stackrel{\sim}{A} \stackrel{\vee}{b} \stackrel{\sim}{\Rightarrow} \stackrel{\sim}{x} = \stackrel{\sim}{a} \stackrel{\sim}{b} \stackrel{\sim}{\Rightarrow} \stackrel{\sim}{x} = \stackrel{\sim}{a} \stackrel{\sim}$

Theorem 6

a. If A is an invertible matrix, then $A^{-1}\,$ is invertible and

$$\left(A^{-1}
ight)^{-1}=A$$

b. If A and B are $n \times n$ invertible matrices, then so is AB, and the inverse of AB is the product of the inverses of A and B in the reverse order. That is,

$$(AB)^{-1} = B^{-1}A^{-1}$$

c. If A is an invertible matrix, then so is $A^T,\,$ and the inverse of $A^T\,$ is the transpose of $A^{-1}.\,$ That is,

Proofs: a) Find
$$(A^{-1})^{T}$$

 $A^{-1} = I$, $A^{-1} c = I$, $(A = I)^{T}$
 $A = I$, $(A = I)^{T}$, $(A = I)^{T} = I$
 $A = I$, $(A = I)^{T} = I$
 $A = I$, $(A = I)^{T} = I$
 $A = I$, $(A = I)^{T} = I$
 $A = I$, $(A = I)^{T} = I$
 $A = I$, $(A = I)^{T} = I$
 $A = I$
 A

 $(AB)^{-1} = B^{-1}A^{-1}$

From Theorem 6b, we can extrapolate to the following.

The product of $n \times n$ invertible matrices is invertible, and the inverse is the product of their inverses in the reverse order. $(ABCD)^{-1} = D^{-1}C^{-1}B^{-1}A^{-1}$

(Read pages 108-109 on Elementary Matrices)

We are going to look at finding the inverse of a matrix with a slightly different approach than this text.

If an $n \times n$ matrix A has an inverse, let's call that matrix B. Then

$$AB = I$$

This can be written as

. -

 $\begin{bmatrix} A \vec{b}_1 & A \vec{b}_2 & A \vec{b}_3 & \dots & A \vec{b}_n \end{bmatrix} = \begin{bmatrix} \vec{e}_1 & \vec{e}_2 & \vec{e}_3 & \dots & \vec{e}_n \end{bmatrix}$

We can think of this as many systems, where each solution forms the columns vectors of our matrix B. ホーネ

Theorem 7

An $n \times n$ matrix A is invertible if and only if A is row equivalent to I_n , and in this case, any sequence of elementary row operations that reduces A to I_n also transforms I_n into A^{-1} .

$$\begin{bmatrix} A' \\ \end{bmatrix} \xrightarrow{\text{rref}} \begin{bmatrix} I \\ A' \end{bmatrix}$$

Algorithm for Finding A^{-1}

Row reduce the augmented matrix $[A \ I]$. If A is row equivalent to I, then $[A \ I]$ is row equivalent to $[I \ A^{-1}]$. Otherwise, A does not have an inverse.

Ex 5: Find the inverse of the matrix
$$A = \begin{bmatrix} 1 & -2 & -1 \\ -1 & 5 & 6 \\ 5 & -4 & 5 \end{bmatrix}$$
, if it exists.
(Do this by hand – more practice.)
 $\begin{bmatrix} 1 & -2 & -1 & | & 0 & 0 \\ -1 & 5 & 6 & 0 & | & 0 \\ -1 & 5 & 6 & 0 & | & 0 \\ 5 & -4 & 5 & 0 & 0 & | \\ 5 & -4 & 5 & 0 & 0 & | \\ 5 & -4 & 5 & 0 & 0 & | \\ -5R_1 + R_3 \begin{bmatrix} 1 & -2 & -1 & | & 0 & 0 \\ 0 & 3 & 5 & | & 1 & 0 \\ 0 & 6 & | & 0 & -5 & 0 & | \\ 0 & 6 & | & 0 & -5 & 0 & | \\ 0 & 3 & 5 & | & 1 & 0 \\ 0 & 3 & 5 & | & 1 & 0 \\ 0 & 3 & 5 & | & 1 & 0 \\ 0 & 3 & 5 & | & 1 & 0 \\ 0 & 3 & 5 & | & 1 & 0 \\ 0 & 0 & -7 & -2 & | \\ A & IS & Not invertible \end{bmatrix}$
