BI 348 Project 6

There are two problems to complete for this Project #6. Problem #1 will be completed using Power BI Desktop and problem #2 will be completed using Excel Power Pivot. For both problems, name things with names that communicate the meaning of the objects. When you are done with both problem #1 and problem #2, upload both files at the same time into the Week 9-10 area of the Home tab in Canvas.

Problem #1: Create a Power BI Desktop file with three pages.

The goal will be to download data from a Seattle government web site, import the data into a new Power BI Desktop file and create these three pages:

Here are the general steps you can take to complete this Problem #1:

- 1. Open up a new Power BI Desktop file and use the F12 key to Save As and name your file: "YourNameBI348-Project06-Spring2022.pbix".
- 2. Using Power Query, import the CSV file named "Code_Complaints_and_Violations.csv".
- 3. Name the query with a name that conveys the meaning of the data. Do not leave the default file name "Code_Complaints_and_Violations" as the name of the query.
- 4. Remove all fields in table, except these fields:
 - i. RecordType
 - ii. RecordTypeDesc
 - iii. Description
 - iv. OriginalAddress1
 - v. OpenDate
 - vi. Latitude
 - vii. Longitude
- 5. Filter out null values in Latitude field.
- 6. Make sure each field has the correct data type.
- 7. Apply & Close the table to the Data Model.
- 8. Create a Date Table in the Data Model and name the table dDate. The date table must have at minimum fields for date, month and year.
- 9. Create a Relationship between the dDate Date field and the Open Date field in the fact table.
- 10. In the Fact Table, use the Column tools tab in Power BI Desktop, in the Properties group, to select these fields in the Fact Table and set these properties:
 - i. Latitude:
 - i. Data Category = Latitude
 - ii. Summarization = Don't summarize.
 - ii. Longitude:
 - i. Data Category = Longitude
 - ii. Summarization = Don't summarize.
- 11. Create these three Measures:
 - i. Count (count the rows in the Fact Table)
 - ii. % of Grand Total Count
 - iii. % of Filtered Grand Total Count
- 12. On a New Page create the set of visuals as shown here:

								Visualizations	Fields
		↑ J. I							₽ Search
RecordType	Count % of G	rand Total Count % of Filter	ed Grand Total Count	Year	OriginalAddress1	Count			〜晒 dDate
- Complaint	4 247	2 70%	68.00%	2003	7746 15TH AVE NE 8	8	8		> 🗆 🛅 Date

Total	6,384	4.09%	100.00%		Total	6,384		Add drill-through fields here	

- i. For the above visual on the left, you can use a Matrix visual and sorted the visual by the Count column.
- ii. In the middle is a slicer with year.
- iii. For the above visual on the right, you can use a Table visual and sorted the visual by the Count column.
- 13. On a New Page create the set of visuals as shown here:

- i. You can use the Map visual with latitude and longitude.
- ii. Then you can add a slicer for year and RecordType.

14. On a New Page create the set of visuals as shown here:

- You can use the Word Cloud visual. This is a good visual for the description field in the data set because this field does not have a set of consistent categories. This visual shows that in Seattle, of all the complaints and violations in the city, most are about vegetation, sidewalks and weeds.
- ii. In the Format tab (Paint Roller), you can turn on "Default Stop Words, to not show words like "the" and "and" in the visual.

i.

Problem #2: Create a new Excel file with a Power Pivot report.

The goal is to connect to the data in an online SQL database and create a simple Total Revenue & Total COGS by Product Report. The data base that you will access for this problem is located at the same online sever, but it is a different database. The database that you used in EDA video #4 was named "boomdata". The database that you access for this problem is named "boomerang".

Credentials to access SQL Server Database:

- Server = pond.highline.edu
- Database name = boomerang
- User = excelisfun
- Password: = ExcellsFun!

Here are the general steps you can take to complete this Problem #2:

- 1. Open a new blank Excel file and save it with a file name that includes your name.
- 2. Using Power Query and the credentials above, access the boomerang SQL Server Database and import the fTransactions and dProduct Tables into the Power Pivot Data Model.
 - a. If a message says that it "can not encrypt the data", click the OK button.
 - b. You must import only two tables: fTransactions and dProduct. Do not import any of the other tables.
- 3. In the Fact Table, remove the TransactionID field (too many unique records that we do not need. If we did import them, it would make the columnar database very big).
- 4. Remove an related columns that contains data from the many side of the relationship.
- 5. Create a Date Table in the Data Model.
- 6. Create the Relationships.
- 7. Create a Measures for Total Revenue. Create a Measure using the One-Step Method.
- 8. Create a Measure for Total COGS. Create a Measure using the One-Step Method.
- 9. Create a Report and a Chart for Total Revenue & Total COGS by Product. Here is a picture:

- 18	A	Б	L L	U		
1						
2		Product 💌	Total Revenue (\$)	Total COGS(\$)		
3		Alpine	87,505,399.66	54,573,137.42		
4		Aspen	104,689,106.48	61,298,425.46
